

[Tittle of the document] Abstract

[Abstract]

The object of the invention is to easily perform maintenance of the side blinker for a door mirror comprising a mirror portion and a side winker which is one example of lamp bodies. A second opening H2 is formed on the back side of a mirror housing 2, and fixing pieces 2c are formed on the second opening H2, while a lamp unit LU is constructed by integrating a lens portion 6 with the back face of a base body having an inner base 4 and an outer base 5 which covers the front face of the inner base 4, and this lamp unit LU is assembled into the second opening H2 through the back face side of the mirror housing 2, and fixing pieces 5g of the lamp unit LU and the mirror housing-fixing pieces 2c are tightened by screws 15.
